HPC (High Pressure Compressor) Degradation - Repair Manual

Symptoms: Elevated core temperature readings, increased fuel consumption, gradual pressure ratio decline across the compressor stages.

Common Causes:
- Blade erosion due to particulate ingestion
- Seal wear leading to internal air leakage
- Fouling of compressor blades reducing aerodynamic efficiency

Recommended Actions:
1. Perform borescope inspection of HPC blades for erosion or damage
2. Check and clean compressor inlet filters
3. Inspect interstage seals for wear beyond tolerance
4. If blade erosion exceeds 5% chord length, schedule blade replacement
5. Water wash compressor section to remove fouling deposits

Priority: HIGH - HPC degradation directly impacts engine efficiency and can lead to compressor stall if left unaddressed.
